

Your next round — the Build Sprint

AI Native Mentor (Intern) — Frontier School of Technology

Congratulations!! Out of nearly **3,000 applications**, your application and your video put **you in the top 30**. We enjoyed watching your explanation — that is genuinely the hardest part of this role, and you did it well.

Here is what happens next.

What this round is

A **six-hour build sprint**. You can choose a small, real brief and build something that works, using any tools and any AI you like, and then you walk us through it.

This is not a coding test with hidden answers. It mirrors the actual job: take a brief you have not seen before, use AI well, get something working, and be able to explain it to somebody else.

The time-box

Six hours from the moment you tell us you have started.

Reply to confirm when you are beginning, and your six hours start from there. Pick a window when you can actually work — we would rather you start tomorrow morning fresh than at 11pm tonight.

The time-box is real, but it is not a trap. We are not measuring how fast you type. We are looking at what you choose to build when the clock is against you — a small thing that works beats a big thing that half-works, every time

What to submit

Two links, sent in a single reply:

1. **A repository link** (GitHub, or anywhere we can see the code)
2. **A screen recording, about five minutes**, covering three things:
 - **Show it working.** Actually, run it. Do not talk over slides or a static screen.
 - **Explain one design decision you made** — something where you chose one approach over another, and why.
 - **Tell us one thing the AI got wrong, and how you fixed it.** This one matters to us. Everybody using AI seriously hits this. We want to hear how you spotted it and what you did.

Upload the recording anywhere — Google Drive, YouTube unlisted, Loom.

Please check your link before you send it. In the last round we could not open almost a quarter of the videos we were sent. The two most common problems: sharing a Drive *folder* instead of the file itself, and forgetting to set access to "anyone with the link can view". Open your own link in a private browser window to be sure.

What we are looking for

We score four things, each out of 5. We would rather tell you than have you guess:

	What it means
It works	End to end, however simple. A small working tool beats an ambitious broken one.
AI leverage	You used AI as an amplifier, not a crutch — and you can explain what it wrote and why.
Clarity of explanation	Someone junior could follow your recording.
Judgment	Sensible scope, sensible decisions, sensible trade-offs for six hours.

The rules — deliberately few

- **Any stack, any language, any framework.** Use what you are fastest in.
- **Any AI tools.** ChatGPT, Claude, Cursor, Copilot, v0, whatever you like. We expect you to use them — this is an AI-native role.
- **Working beats pretty.** Do not spend your last hour on CSS.
- **Scope down, not up.** Cutting a feature to ship something solid is a good decision, and we will read it as one.
- **Your own work.** Use AI as much as you want, but the decisions and the explanation must be yours. We will ask about them.

A note on honesty

The single thing that will help you most in this round is being straight with us about what you did and did not do. If AI wrote most of a file, say so — and then tell us what you changed and why. That reads as strength, not weakness.

The opposite also holds. Claiming to have written something you cannot explain is the fastest way out of this process.

If you get stuck

Getting stuck is part of it. Work through it the way you would on the job — that is part of what we are looking at.

But if something is blocking you that is not about the problem itself — the brief is unclear, a tool is down, something has happened at home — message us. We would much rather hear from you early than receive nothing.

What comes after this

If you clear the sprint, the next round is the one that really decides it: a **learn-and-teach challenge**. We give you a topic you almost certainly do not know. You get 24 hours to master it using AI, then you teach it live to our panel in a short do-along session, where we follow along on our own laptops and ask you questions.

That is the job, essentially. This sprint is how we get you there.

Practical details

Time-box	6 hours from when you confirm you have started
Submit to	The same WhatsApp number / email that sent you this
Submit	Repository link + ~5-minute screen recording
Questions	Reply on the same thread — we answer quickly

Good luck. Build something small that works, and tell us the truth about how you built it.
